(Object) capabilities

- A capability both designates a resource and provides authority to access it
- Similar to an object reference
  - Unforgeable, but can copy and distribute
- Typically still managed by the kernel

Capability slogans (Miller et al.)

- No designation with authority
- Dynamic subject creation
- Subject-aggregated authority mgmt.
- No ambient authority
- Composability of authorities
- Access-controlled delegation
- Dynamic resource creation

Revocation with capabilities

- Use indirection: give real capability via a pair of middlemen
  - A → B via A → F → R → B
- Retain capability to tell R to drop capability to B
- Depends on composability

Confinement with capabilities

- A cannot pass a capability to B if it cannot communicate with A at all
- Disconnected parts of the capability graph cannot be reconnected
- Depends on controlled delegation and data/capability distinction
**OKL4 and seL4**
- Commercial and research microkernels
- Recent versions of OKL4 use capability design from seL4
- Used as a hypervisor, e.g. underneath paravirtualized Linux
- Shipped on over 1 billion cell phones

**Joe-E and Caja**
- Dialects of Java and JavaScript (resp.) using capabilities for confined execution
  - E.g., of JavaScript in an advertisement
  - Note reliance on Java and JavaScript type safety

**Outline**
- Capability-based access control
- OS trust and assurance
- Assignment debrief and announcements
- More Unix access control

**Trusted and trustworthy**
- Part of your system is trusted if its failure can break your security
- Thus, OS is almost always trusted
- Real question: is it trustworthy?
- Distinction not universally observed: trusted boot, Trusted Solaris, etc.

**Trusted (I/O) path**
- How do you know you’re talking to the right software?
- And no one is sniffing the data?
- Example: Trojan login screen
  - Or worse: unlock screensaver with root password
  - Origin of “Press Ctrl-Alt-Del to log in”

**Minimizing trust**
- Kernel → microkernel → nanokernel
- Reference monitor concept
- TCB size: measured relative to a policy goal
- Reference monitor ⊆ TCB
  - But hard to build monitor for all goals
How to gain assurance

- Use for a long time
- Testing
- Code / design review
- Third-party certification
- Formal methods / proof

Evaluation / certification

- Testing and review performed by an independent party
- Goal: separate incentives, separate accountability
- Compare with financial auditing
- Watch out for: form over substance, misplaced incentives

Orange book OS evaluation

- Trusted Computer System Evaluation Criteria
  - D. Minimal protection
  - C. Discretionary protection
    - C2 adds, e.g., secure audit over C1
  - B. Mandatory protection
    - B1< B2< B3: stricter classic MLS
  - A. Verified protection

Common Criteria

- International standard and agreement for IT security certification
- Certification against a protection profile, and evaluation assurance level EAL 1-7
- Evaluation performed by non-government labs
- Up to EAL 4 automatically cross-recognized

Common Criteria, Anderson’s view

- Many profiles don’t specify the right things
- OSes evaluated only in unrealistic environments
  - E.g., unpatched Windows XP with no network attacks
  - “Corruption, Manipulation, and Inertia”
    - Pernicious innovation: evaluation paid for by vendor
    - Labs beholden to national security apparatus

Formal methods and proof

- Can math come to the rescue?
- Checking design vs. implementation
- Automation possible only with other tradeoffs
  - E.g., bounded size model
- Starting to become possible: machine-checked proof
Proof and complexity

- Formal proof is only feasible for programs that are small and elegant
- If you honestly care about assurance, you want your TCB small and elegant anyway
- Should provability further guide design?

Some hopeful proof results

- seL4 microkernel (SOSP’09 and ongoing)
  - 7.5 kL C, 200 kL proof, 160 bugs fixed, 25 person years
- CompCert C-subset compiler (PLDI’06 and ongoing)
- RockSalt SFI verifier (PLDI’12)

Outline

- Capability-based access control
- OS trust and assurance
- Assignment debrief and announcements
- More Unix access control

Note to early readers

- This is the section of the slides most likely to change in the final version
- If class has already happened, make sure you have the latest slides for announcements

BCLPR vulnerabilities discovered!

- Buffer overflow in check_permissions
- Incorrect check in check_permissions
  - Exploitable by printing (stealing) root’s SSH private key
- New limits and hardening (W×X!) in 1.4

A subtle difference

- My mistake: a too-easy-to-bypass check
  - if (endptr > fullpath + PATH_MAX)
  - if (endptr - fullpath > PATH_MAX)
HA1 week 5

- Extra credit, for those who found weeks 1-4 too easy
- More subtle bugs and tricky exploit techniques
- Are there any bugs I didn't introduce on purpose?

Reversing the stack

```c
void func(char *str) {
    char buf[128];
    strcpy(buf, str);
do_something();
    return;
}
```

Payment app

```c
void payment(char *name, int amount_gbp, char *purpose) {
    int amount_usd = (amount_gbp*156)/100;
    char memo[32];
    strcpy(memo, "Payment for: ");
    strcat(memo, purpose);
    write_check(name, amount_usd, memo);
}
```

Big- and little-endian

- **Overwriting** 0x12345678 with "...AAAAA\0":
  - 0x00345678
  - 0x41005678
  - 0x41410078
  - 0x41414100
  - 0x41414141

Zip function

```c
char *zip(char *a, char *b) {
    char *result;
    int len, i;
    len = strlen(a);
    result = malloc(2*len);
    for(i = 0; i <= len; i++) {
        result[2*i] = a[i];
        result[2*i+1] = b[i];
    }
    return result;
}
```
BCLPR design changes

- Avoid unnecessary changes to benign functionality
  - Restricting length or character sets of arguments
  - Though, what is the benign functionality?
- Not a great candidate for privilege separation
  - 500 LOC is not large! (LPRNG 45k, CUPS 371k)

Midterm exam next Tuesday

- Usual class time and location
- Covers up through today’s lecture
- Mix of short-answer and exercise-like questions
- Open books/notes/printouts, no computers or other electronics

Outline

- Capability-based access control
- OS trust and assurance
- Assignment debrief and announcements
- More Unix access control

Special case: /tmp

- We’d like to allow anyone to make files in /tmp
- So, everyone should have write permission
- But don’t want Alice deleting Bob’s files
- Solution: “sticky bit” 01000

Special case: group inheritance

- When using group to manage permissions, want a whole tree to have a single group
- When 02000 bit set, newly created entries with have the parent’s group
  - (Historic BSD behavior)
- Also, directories will themselves inherit 02000

“POSIX” ACLs

- Based on a withdrawn standardization
- More flexible permissions, still fairly Unix-like
- Multiple user and group entries
  - Decision still based on one entry
- Default ACLs: generalize group inheritance
- Command line: getfacl, setfacl
ACL legacy interactions
- Hard problem: don’t break security of legacy code
  - Suggests: “fail closed”
- Contrary pressure: don’t want to break functionality
  - Suggests: “fail open”
- POSIX ACL design: old group permission bits are a mask on all novel permissions

“POSIX” “capabilities”
- Divide root privilege into smaller (~35) pieces
- Note: not real capabilities
- First runtime only, then added to FS similar to setuid
- Motivating example: ping
- Also allows permanent disabling

Privilege escalation dangers
- Many pieces of the root privilege are enough to regain the whole thing
  - Access to files as UID 0
  - CAP_DAC_OVERRIDE
  - CAP_FOWNER
  - CAP_SYS_MODULE
  - CAP_MKNOD
  - CAP_PTRACE
  - CAP_SYS_ADMIN (mount)

Legacy interaction dangers
- Former bug: take away capability to drop privileges
- Use of temporary files by no-longer setuid programs
- For more details: “Exploiting capabilities”, Emeric Nasi

Next time
- Application: electronic voting
