Introduction

Ch 1

How many programmers does it take to change a light bulb?
None. It's a hardware problem.
15% Labs
30% Homework (due Thursdays)
  5% Quiz (Oct. 7)
10% Midterm 1 (Oct. 21)
15% Midterm 2 (Nov. 23)
25% Final (Dec 19. 10:30am-12:30pm, this room)
Some people need a “sponsor”, use me:

James Parker
park0580
CSci1103 student
Object Oriented

Main focus is on objects and how they interact (represented by me as boxes)

Reusable groups of actions (verbs) between objects are called functions (squiggly boxes)

These actions can take additional information called arguments, (an analogy is ordering at a restraunt; the ordering format is the same, different food)
Object Oriented

One format is:
object.function(argument, argument...);

Example:
James.teaches(CSci 1113);
teach(James, CSci 1113);

The dot (period) shows that “teaching” is an action done by “James”
Banana Nut Bread

Ingredients
* 3 or 4 ripe bananas, smashed
* 1/3 cup melted butter
* 1 cup sugar
* 1 egg, beaten
* 1 teaspoon vanilla
* 1 teaspoon baking soda
* Pinch of salt
* 1 1/2 cups of all-purpose flour
* 1 cup of nuts
Banana Nut Bread

Directions
1. Preheat the oven to 350°F (175°C).
2. Mix butter into the mashed bananas in a large mixing bowl.
3. Mix in the sugar, egg, and vanilla.
4. Sprinkle the baking soda and salt over the mixture and mix in.
5. Add the flour and nuts last, mix.
6. Pour mixture into a buttered 4x8 inch loaf pan.
Banana Nut Bread

Directions
1. Preheat the oven to 350°F (175°C).
2. Mix butter into the mashed bananas in a large mixing bowl.
3. Mix in the sugar, egg, and vanilla.
4. Sprinkle the baking soda and salt over the mixture and mix in.
5. Add the flour and nuts last, mix.
6. Pour mixture into a buttered 4x8 inch loaf pan.
Banana Nut Bread

Directions
1. **Preheat** the oven to 350°F (175°C).
2. **Mix** butter into the mashed bananas in a large mixing bowl.
3. **Mix** in the sugar, egg, and vanilla.
4. **Sprinkle** the baking soda and salt over the mixture and mix in.
5. **Add** the flour and nuts last, mix.
6. **Pour** mixture into a buttered 4x8 inch loaf pan.
7. **Bake** for 1 hour. Cool on a rack.
Banana Nut Bread

Pseudo code directions
1. \texttt{oven.preheat}(350);
2. \texttt{bowl.mix}(butter, bananas);
3. \texttt{bowl.mix}(sugar, egg, vanilla);
4. \texttt{bowl.sprinkle}(baking soda, salt);
5. \texttt{bowl.mix}(flour, nuts);
6. \texttt{bowl.pour}(pan);
7. \texttt{pan.bake}(60);
8. \texttt{pan.cool}();
Banana Nut Bread

Pseudo code directions #2
1. oven.preheat(350);
2. bowl.add(butter, bananas);
3. bowl.mix();
4. bowl.add(sugar, egg, vanilla);
5. bowl.mix();
6. bowl.sprinkle(baking soda, salt);
7. bowl.add(flour, nuts);
8. bowl.mix();
9. pan.pour(bowl);
10. pan.bake(60);
11. pan.cool();
mashedBananas = bananas.mashed();

bowl.add(butter, mashedBananas);

same as:
bowl.add(butter, bananas.mashed());

Kitchen.bowl.add(butter, bananas.mashed());

hand.mix(butter, mashedBananas);
bowl.add(hand.mix(butter, mashedBananas));
Compiling

Converting **code** to binary is called **compiling**
Compiling

Often this compiled code will not work on other computers.
Compiling
Compiling

C++ is a high level language (human readable)

Compiling changes a high level language into a low level language that is easier for the computer (computer cannot run high level)
Compiling

Your **source code** is the original language you wrote your program in (the C++ code for us)

You must **recompile** the **source code** every time you save a change before running the program again.
In labs, the computers will come with a program called “geany” (which I will use too)

This program is where you can write code and easily compile simple programs

To run it either click the terminal icon ( ) on the left bar or press Ctrl+Alt+T

Then type:  geany  (enter)
Compiling tl;dr

directions

cook

meal

eat

satiated

code

compile

1's and 0's

run

pretty colors
High level (C++)

#include <iostream>
using namespace std;

int main ()
{
    cout << "Hello World! ";
    return 0;
}

(See: helloWorld.cpp)
MODEL SMALL
IDEAL
STACK 100H

DATASEG
MSG DB 'Hello, World!', 13, '$'

CODESEG
Start:
MOV AX, @data
MOV DS, AX
MOV DX, OFFSET MSG
MOV AH, 09H ; output ascii string
INT 21H
MOV AX, 4C00H
INT 21H
END Start
Ease of use
Why C++?

Speed
Control
Libraries
Speed

Not all programming languages need to compile code as C++ (Java, Python).

Compiling can greatly increase speed of a program.
C++ allows you great control over your data (and its interpretation)

This comes with a burden of responsibility to properly manage your data

If you mismanage your data, you are likely to cause an error in your program
C++ is an old language (older than me) and this comes with pros and cons...

Some aspects are quirky to enable backwards compatibility (and are honestly out of date)

Since it has been around for a long time, there are lots of supporting libraries (and the language continues to develop...)
Java vs C++

Java
- Goes anywhere
- Comfy

C++
- Fast
- Fine tuned
Magic 8 ball
Magic 8 ball

What a rip off!
```cpp
#include <iostream>
using namespace std;

int main()
{
    cout << "Maybe."
    return 0;
}
```
Keyboard input

cout << “word”
   - prints “word” to the screen

    cin >> x
    - store what is typed into “x”
      (x is some object or data)

Can also do arithmetic using +, -, / and *
   (see: inputOutput.cpp)
Types of errors

- Syntax error - code will not compile
e.g. cout(“hi”);

- Runtime error - code crashes after starting
e.g. (0 input to runTimeError.cpp)

- Logic error - code runs but doesn't return the correct answer
(see: logicError.cpp)
Syntax is a fancy word for the “grammar” of programming languages.

The basic English syntax is: (subject) (verb) (noun)
“I eat bananas” not “Bananas I eat”

The computer is VERY picky (and stubborn) about grammar, and will not understand you unless you are absolutely correct!
Avoid errors

To remove your program of bugs, you should try to test your program on a wide range of inputs.

Typically it is useful to start with a small piece of code that works and build up rather than trying to program everything and then debug for hours.
Comments

Comments are ignored pieces of code (computer will pretend they do not exist)

// denotes a single line that is commented
// (everything before hitting enter)

/* denotes the beginning of a comment
and the end of a comment is denoted by */
Additional facts

Braces denote a block of code  
(belonging to a method, class, etc.)

“White space” is ignored, just as the your brain will ignore the bottom third of this slide (this is why we need a semi-colon)
