## Inner products and Norms

*Inner product of 2 vectors* 

 $\blacktriangleright$  Inner product of 2 vectors x and y in  $\mathbb{R}^n$ :

$$x_1y_1+x_2y_2+\cdots+x_ny_n$$
 in  $\mathbb{R}^n$ 

Notation: (x,y) or  $y^Tx$ 

For complex vectors

$$(x,y)=x_1ar{y}_1+x_2ar{y}_2+\cdots+x_nar{y}_n$$
 in  $\mathbb{C}^n$ 

Note:  $(x,y) = y^H x$ 

ullet On notation: Sometimes you will find  $\langle .,. 
angle$  for (.,.) and  $A^*$  instead of  $A^H$ 

2-2 GvL 2.2-2.3; - Norms

2-2

# Properties of Inner Product:

- $ightharpoonup (x,y) = \overline{(y,x)}.$
- $ightharpoonup (\alpha x + \beta y, z) = \alpha(x, z) + \beta(y, z)$  [Linearity]
- $(x,x) \ge 0$  is always real and non-negative.
- (x,x)=0 iff x=0 (for finite dimensional spaces).
- ightharpoonup Given  $A \in \mathbb{C}^{m imes n}$  then

$$(Ax,y)=(x,A^Hy) \ \ orall \ x \ \in \ \mathbb{C}^n, orall y \ \in \ \mathbb{C}^m$$

### Vector norms

Norms are needed to measure lengths of vectors and closeness of two vectors. Examples of use: Estimate convergence rate of an iterative method; Estimate the error of an approximation to a given solution;

ightharpoonup A vector norm on a vector space  $\mathbb X$  is a real-valued function on  $\mathbb X$ , which satisfies the following three conditions:

- 1.  $||x|| \ge 0$ ,  $\forall x \in X$ , and ||x|| = 0 iff x = 0.
- $2. \|\alpha x\| = |\alpha| \|x\|, \quad \forall \ x \in \mathbb{X}, \quad \forall \alpha \in \mathbb{C}.$
- 3.  $||x + y|| \le ||x|| + ||y||$ ,  $\forall x, y \in X$ .
- ➤ Third property is called the triangle inequality.

2-4 \_\_\_\_\_ GvL 2.2-2.3; - Norms

Important example: Euclidean norm on  $\mathbb{X} = \mathbb{C}^n$ ,

on 
$$\mathbb{X}=\mathbb{C}^n$$
,

$$||x||_2 = (x,x)^{1/2} = \sqrt{|x_1|^2 + |x_2|^2 + \ldots + |x_n|^2}$$

Show that when Q is orthogonal then  $||Qx||_2 = ||x||_2$ 

Most common vector norms in numerical linear algebra: special cases of the Hölder norms (for  $p \geq 1$ ):

$$\|x\|_p = \left(\sum_{i=1}^n |x_i|^p
ight)^{1/p}.$$

Find out (online search) how to show that these are indeed norms for any p > 1 (Not easy for 3rd requirement!)

Property:

The Cauchy-Schwartz inequality (important) is:

$$|(x,y)| \leq ||x||_2 ||y||_2.$$

Mhen do you have equality in the above relation?

Expand (x + y, x + y). What does the Cauchy-Schwarz inequality imply?

 $\blacktriangleright$  The Hölder inequality (less important for  $p \neq 2$ ) is:

$$|(x,y)| \leq \|x\|_p \|y\|_q$$
 , with  $rac{1}{p} + rac{1}{q} = 1$ 

✓<sub>5</sub> Second triangle inequality: |||x|| - ||y||| < ||x - y||.

Consider the metric  $d(x,y)=max_i|x_i-y_i|$ . Show that any norm in  $\mathbb{R}^n$  is a continuous function with respect to this metric.

GvL 2.2-2.3; - Norms

 $\lim_{p\to\infty} \|x\|_p = \max_{i=1}^n |x_i|$ 

 $\blacktriangleright$  Limit of  $||x||_p$  when  $p \to \infty$  exists:

Defines a norm denoted by  $\|.\|_{\infty}$ .

The cases p=1, p=2, and  $p=\infty$  lead to the most important norms  $\|.\|_p$  in practice. These are:

$$\|x\|_1 = |x_1| + |x_2| + \cdots + |x_n|, \ \|x\|_2 = \left[|x_1|^2 + |x_2|^2 + \cdots + |x_n|^2\right]^{1/2}, \ \|x\|_\infty = \max_{i=1,...,n} |x_i|.$$

# Equivalence of norms:

In finite dimensional spaces ( $\mathbb{R}^n$ ,  $\mathbb{C}^n$ , ..) all norms are 'equivalent': if  $\phi_1$  and  $\phi_2$  are two norms then there exists positive constants  $\alpha, \beta$ such that:

$$\beta \phi_2(x) \le \phi_1(x) \le \alpha \phi_2(x).$$

How can you prove this result? [Hint: Show for  $\phi_2 = \|.\|_{\infty}$ ]

We can bound one norm in terms of any other norm.

Show that for any x:  $\frac{1}{\sqrt{n}} ||x||_1 \le ||x||_2 \le ||x||_1$ 

Mhat are the "unit balls"  $B_p = \{x \mid \|x\|_p \leq 1\}$  associated with the norms  $\|.\|_p$  for  $p=1,2,\infty$ , in  $\mathbb{R}^2$ ?

GvL 2.2-2.3; - Norms

## Convergence of vector sequences

A sequence of vectors  $x^{(k)}$ ,  $k=1,\ldots,\infty$  converges to a vector x with respect to the norm  $\|\cdot\|$  if, by definition,

$$\lim_{k o\infty}\ \|x^{(k)}-x\|=0$$

- Important point: because all norms in  $\mathbb{R}^n$  are equivalent, the convergence of  $x^{(k)}$  w.r.t. a given norm implies convergence w.r.t. any other norm.
- ➤ Notation:

$$\lim_{k o\infty}x^{(k)}=x$$

2-9 GvL 2.2-2.3; - Norm

2-9

Example: The sequence

$$x^{(k)} = egin{pmatrix} 1+1/k \ rac{k}{k+\log_2 k} \ rac{1}{k} \end{pmatrix}$$

converges to

$$x = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$$

Note: Convergence of  $x^{(k)}$  to x is the same as the convergence of each individual component  $x_i^{(k)}$  of  $x^{(k)}$  to the corresponding component  $x_i$  of x.

#### Matrix norms

- ightharpoonup Can define matrix norms by considering  $m \times n$  matrices as vectors in  $\mathbb{R}^{mn}$ . These norms satisfy the usual properties of vector norms, i.e.,
  - 1.  $||A|| \geq 0$ ,  $\forall A \in \mathbb{C}^{m \times n}$ , and ||A|| = 0 iff A = 0
  - 2.  $\|\alpha A\| = |\alpha| \|A\|, \forall A \in \mathbb{C}^{m \times n}, \forall \alpha \in \mathbb{C}$
  - 3.  $||A + B|| \le ||A|| + ||B||, \ \forall \ A, B \in \mathbb{C}^{m \times n}$ .
- ➤ However, these will lack (in general) the right properties for composition of operators (product of matrices).
- $\triangleright$  The case of  $\|.\|_2$  yields the Frobenius norm of matrices.

 $\triangleright$  Given a matrix A in  $\mathbb{C}^{m\times n}$ , define the set of matrix norms

$$\|A\|_p = \max_{x \in \mathbb{C}^n, \; x 
eq 0} rac{\|Ax\|_p}{\|x\|_p}.$$

- These norms satisfy the usual properties of vector norms (see previous page).
- $\blacktriangleright$  The matrix norm  $\|.\|_p$  is induced by the vector norm  $\|.\|_p$ .
- $\blacktriangleright$  Again, important cases are for  $p=1,2,\infty$ .
- lacksquare Show that  $\|A\|_p = \max_{x \in \mathbb{C}^n, \; \|x\|_p = 1} \; \|Ax\|_p$

GVL 2.2-2.3, - NO

## Consistency / sub-mutiplicativity of matrix norms

➤ A fundamental property of matrix norms is consistency

$$||AB||_p \leq ||A||_p ||B||_p$$
.

[Also termed "sub-multiplicativity"]

- ightharpoonup Consequence: (for square matrices)  $\|A^k\|_p \leq \|A\|_p^k$
- $ightharpoonup A^k$  converges to zero if any of its p-norms is < 1

[Note: sufficient but not necessary condition]

GvL 2.2-2.3; — Norms

2-13

∠onpute the Frobenius norms of the matrices

$$\begin{pmatrix} 1 & 1 \\ 1 & 0 \\ 3 & 2 \end{pmatrix} \quad \begin{pmatrix} 1 & 2 & -1 \\ -1 & \sqrt{5} & 0 \\ -1 & 1 & \sqrt{2} \end{pmatrix}$$

Prove that the Frobenius norm is consistent [Hint: Use Cauchy-Schwartz]

Define the 'vector 1-norm' of a matrix A as the 1-norm of the vector of stacked columns of A. Is this norm a consistent matrix norm?

[Hint: Result is true – Use Cauchy-Schwarz to prove it.]

#### Frobenius norms of matrices

The Frobenius norm of a matrix is defined by

$$\|A\|_F = \left(\sum_{j=1}^n \sum_{i=1}^m |a_{ij}|^2\right)^{1/2}.$$

- $\triangleright$  Same as the 2-norm of the column vector in  $\mathbb{C}^{mn}$  consisting of all the columns (respectively rows) of A.
- ➤ This norm is also consistent [but not induced from a vector norm]

-14 GvL 2.2-2.3; - Norms

2-14

#### Expressions of standard matrix norms

Recall the notation: (for square  $n \times n$  matrices)  $ho(A) = \max |\lambda_i(A)|; \quad \operatorname{Tr}(A) = \sum_{i=1}^n a_{ii} = \sum_{i=1}^n \lambda_i(A)$  where  $\lambda_i(A)$ ,  $i=1,2,\ldots,n$  are all eigenvalues of A

$$\|A\|_1 = \max_{j=1,...,n} \sum_{i=1}^m |a_{ij}|,$$
  $\|A\|_{\infty} = \max_{i=1,...,m} \sum_{j=1}^n |a_{ij}|,$   $\|A\|_2 = \left[
ho(A^HA)
ight]^{1/2} = \left[
ho(AA^H)
ight]^{1/2},$   $\|A\|_F = \left[\operatorname{Tr}(A^HA)
ight]^{1/2} = \left[\operatorname{Tr}(AA^H)
ight]^{1/2}.$ 

6 \_\_\_\_\_ GvL 2.2-2.3; - Norms

GvL 2.2-2.3; - Norms

Compute the p-norm for  $p=1,2,\infty,F$  for the matrix  $A=egin{pmatrix} 0&2\\0&1 \end{pmatrix}$ 

Arr Show that  $ho(A) \leq \|A\|$  for any matrix norm.

1.  $\rho(A) = \|A\|_2$  when A is Hermitian  $(A^H = A)$ .  $\blacktriangleright$  True for this particular case...

2. ... However, not true in general. For  $A=\begin{pmatrix}0&1\\0&0\end{pmatrix}$ , we have  $\rho(A)=0$  while  $A\neq 0$ . Also, triangle inequality not satisfied for the pair A, and  $B=A^T$ . Indeed,  $\rho(A+B)=1$  while  $\rho(A)+\rho(B)=0$ .

Given a function f(t) (e.g.,  $e^t$ ) how would you define f(A)? [Was seen earlier. Here you need to fully justify answer. Assume A is diagonalizable]

2-17 \_\_\_\_\_\_ GvL 2.2-2.3; - Norm

. . . .

Singular values and matrix norms

- ightharpoonup Let  $A \in \mathbb{R}^{m imes n}$  or  $A \in \mathbb{C}^{m imes n}$
- ightharpoonup Eigenvalues of  $A^HA$  &  $AA^H$  are real  $\geq 0$ . ightharpoonup 5 Show this.
- $lacksquare ext{Let} egin{array}{l} oldsymbol{\sigma}_i = \sqrt{\lambda_i(A^HA)} \ i = 1, \cdots, n \ ext{ if } n \leq m \ \sigma_i = \sqrt{\lambda_i(AA^H)} \ i = 1, \cdots, m \ ext{ if } m < n \ \end{array}$
- ightharpoonup The  $\sigma_i$ 's are called singular values of A.
- ightharpoonup Note: a total of  $\min(m,n)$  singular values.
- ightharpoonup Always sorted decreasingly:  $\sigma_1 \geq \sigma_2 \geq \sigma_3 \geq \cdots \sigma_k \geq \cdots$
- We will see a lot more on singular values later

2-18 \_\_\_\_\_\_ GvL 2.2-2.3; - Norms

2-18

 $\triangleright$  Assume we have r nonzero singular values:

$$\sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_r > 0$$

- ➤ Then:
- $ullet \|A\|_2 = \sigma_1 \ ullet \|A\|_F = ig[\sum_{i=1}^r \sigma_i^2ig]^{1/2}$
- More generally: Schatten p-norm (p > 1) defined by

$$\|A\|_{*,p} = \left[\sum_{i=1}^r \sigma_i^p
ight]^{1/p}$$

GvL 2.2-2.3; - Norms

- lacksquare Note:  $\|A\|_{*,p}=p$ -norm of vector  $[oldsymbol{\sigma}_1;oldsymbol{\sigma}_2;\cdots;oldsymbol{\sigma}_r]$
- In particular:  $||A||_{*,1} = \sum \sigma_i$  is called the nuclear norm and is denoted by  $||A||_{*}$ . (Common in machine learning).

A few properties of the 2-norm and the F-norm

- ightharpoonup Let  $A = uv^T$ . Then  $||A||_2 = ||u||_2 ||v||_2$
- ∠n
  18 Prove this result

For any  $A\in\mathbb{C}^{m\times n}$  and unitary matrix  $Q\in\mathbb{C}^{m\times m}$  we have  $\|QA\|_2=\|A\|_2; \quad \|QA\|_F=\|A\|_F.$ 

Show that the result is true for any orthogonal matrix Q (Q has orthonomal columns), i.e., when  $Q \in \mathbb{C}^{p \times m}$  with p > m
