Krylov subspace methods

- Introduction to Krylov subspace techniques
- FOM, GMRES, practical details.
- Symmetric case: Conjugate gradient
- See Chapter 6 of text for details.

Motivation

Common feature of one-dimensional projection techniques:

$$x_{new} = x + \alpha d$$

where d = a certain direction.

- $\triangleright \alpha$ is defined to optimize a certain function.
- \triangleright Equivalently: determine α by an orthogonality constraint

Example

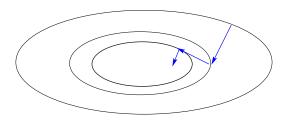

In MR:
$$x(lpha) = x + lpha d$$
, with $d = b - Ax$. $\min_lpha \ \|b - Ax(lpha)\|_2$ reached iff $b - Ax(lpha) \perp r$

One-dimensional projection methods are greedy methods. They are 'short-sighted'.

Example:

Recall in Steepest Descent: New director $r \leftarrow b - Ax$, tion of search \tilde{r} is \perp to old direction of $\alpha \leftarrow (r,r)/(Ar,r)$ search r.

$$\begin{array}{l} r \leftarrow b - Ax, \\ \alpha \leftarrow (r,r)/(Ar,r) \\ x \leftarrow x + \alpha r \end{array}$$

Question: can we do better by combining successive iterates?

➤ Yes: Krylov subspace methods..

Krylov subspace methods: Introduction

descent). At each iteration:

Consider MR (or steepest ent). At each iteration:
$$r_{k+1} = b - A(x^{(k)} + lpha_k r_k) = r_k - lpha_k A r_k = (I - lpha_k A) r_k$$

➤ In the end:

$$r_{k+1} = (I - lpha_k A)(I - lpha_{k-1} A) \cdots (I - lpha_0 A) r_0 = p_{k+1}(A) r_0$$

where $p_{k+1}(t)$ is a polynomial of degree k+1 of the form

$$p_{k+1}(t) = 1 - tq_k(t)$$

Show that: $x^{(k+1)} = x^{(0)} + q_k(A)r_0$, with deg $(q_k) = k$

Krylov subspace methods: iterations of this form that are 'optimal' [from m-dimensional projection methods]

Text: 6 - Krylov1

Krylov subspace methods

Principle: Projection methods on Krylov subspaces:

$$K_m(A,v_1)=\mathsf{span}\{v_1,Av_1,\cdots,A^{m-1}v_1\}$$

- The most important class of iterative methods.
- ullet Many variants exist depending on the subspace L.

Simple properties of $oldsymbol{K}_m$

- Notation: $\mu = \deg$ of minimal polynomial of v. Then:
- $K_m = \{p(A)v|p = \text{polynomial of degree} \le m-1\}$
- $ullet K_m = K_\mu$ for all $m \geq \mu$. Moreover, K_μ is invariant under A.
- $\bullet dim(K_m) = m \text{ iff } \mu \geq m.$

A little review: Gram-Schmidt process

Goal: given $X = [x_1, \ldots, x_m]$ compute an orthonormal set $Q = [q_1, \ldots, q_m]$ which spans the same susbpace.

ALGORITHM: 1. Classical Gram-Schmidt

- 1. For j = 1, ..., m Do:
- 2. Compute $r_{ij} = (x_i, q_i)$ for $i = 1, \ldots, j-1$
- 3. Compute $\hat{q}_j = x_j \sum_{i=1}^{j-1} r_{ij} q_i$
- 4. $r_{ij} = \|\hat{q}_i\|_2$ If $r_{jj} == 0$ exit
- $5. q_i = \hat{q}_i/r_{ii}$
- 6. EndDo

ALGORITHM: 2. Modified Gram-Schmidt

- 1. For j = 1, ..., m Do:
- $2. \quad \hat{q}_i := x_i$
- 3. For $i=1,\ldots,j-1$ Do
- 4. $r_{ij} = (\hat{q}_i, q_i)$
- $\hat{q}_i := \hat{q}_i r_{ij}q_i$
- 7. $r_{ij} = \|\hat{q}_i\|_2$. If $r_{ij} == 0$ exit
- 8. $q_i := \hat{q}_i/r_{ii}$
- 9. EndDo

Let:

$$X = [x_1, \dots, x_m]$$
 $(n \times m \text{ matrix})$

$$oldsymbol{Q} = [q_1, \dots, q_m] \ (n imes m \ {\sf matrix})$$

$$R = \{r_{ij}\}\ (m imes m$$
 upper triangular matrix)

> At each step,

$$x_j = \sum_{i=1}^j r_{ij} q_i$$

Result:

$$X = QR$$

$Arnoldi's \ algorithm$

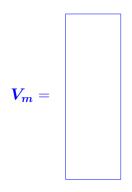

- lacksquare Goal: to compute an orthogonal basis of K_m .
- ▶ Input: Initial vector v_1 , with $||v_1||_2 = 1$ and m.

```
For j=1,...,m Do:
   Compute w:=Av_j
For i=1,...,j Do:
   h_{i,j}:=(w,v_i)
w:=w-h_{i,j}v_i
EndDo
Compute: h_{j+1,j}=\|w\|_2 and v_{j+1}=w/h_{j+1,j}
EndDo
```

3-9 Text: 6 – Krylov J

Result of orthogonalization process (Arnoldi):

- 1. $V_m = [v_1, v_2, ..., v_m]$ orthonormal basis of K_m .
- 2. $AV_m = V_{m+1}\overline{H}_m$
- 3. $V_m^T A V_m = H_m \equiv \overline{H}_m$ last row.

$$AV_m = V_{m+1}\overline{H}_m$$

$$\overline{I}_m = \begin{bmatrix} 0 \end{bmatrix}$$

$$V_{m+1} = [V_m, v_{m+1}]$$

Arnoldi's Method for linear systems $(L_m = K_m)$

From Petrov-Galerkin condition when $L_m=K_m$, we get

$$x_m = x_0 + V_m H_m^{-1} V_m^T r_0$$

ightharpoonup Select $v_1=r_0/\|r_0\|_2\equiv r_0/eta$ in Arnoldi's. Then

$$x_m = x_0 + \beta V_m H_m^{-1} e_1$$

ightharpoonup What is the residual vector $r_m = b - Ax_m$?

Several algorithms mathematically equivalent to this approach:

- * FOM [Y. Saad, 1981] (above formulation), Young and Jea's OR-THORES [1982], Axelsson's projection method [1981],...
- * Also Conjugate Gradient method [see later]

$Minimal\ residual\ methods\ (L_m=AK_m)$

When $L_m = AK_m$, we let $W_m \equiv AV_m$ and obtain relation

$$egin{aligned} x_m &= x_0 + V_m [W_m^T A V_m]^{-1} W_m^T r_0 \ &= x_0 + V_m [(A V_m)^T A V_m]^{-1} (A V_m)^T r_0. \end{aligned}$$

lacksquare Use again $v_1:=r_0/(eta:=\|r_0\|_2)$ and the relation

$$AV_m=V_{m+1}\overline{H}_m$$

 $m{y}$ $x_m = x_0 + V_m [ar{m{H}}_m^T ar{m{H}}_m]^{-1} ar{m{H}}_m^T eta e_1 = x_0 + V_m y_m$ where y_m minimizes $\|eta e_1 - ar{m{H}}_m y\|_2$ over $y \in \mathbb{R}^m$.

➤ Gives the Generalized Minimal Residual method (GMRES) ([Saad-Schultz, 1986]):

$$egin{aligned} x_m &= x_0 + V_m y_m & ext{where} \ y_m &= \min_y \|eta e_1 - ar{H}_m y\|_2 \end{aligned}$$

- > Several Mathematically equivalent methods:
- Axelsson's CGLS Orthomin (1980)
- Orthodir
- GCR

13-13 ______ Text: 6 – Krylov1

ightharpoonup Rotation matrices of dimension m+1. Define (with $s_i^2+c_i^2=1$):

Multiply \bar{H}_m and right-hand side $\bar{g}_0 \equiv \beta e_1$ by a sequence of such matrices from the left. $rack s_i, c_i$ selected to eliminate $h_{i+1,i}$

A few implementation details: GMRES

Issue 1: How to solve the least-squares problem?

Issue 2: How to compute residual norm (without computing solution at each step)?

- ➤ Several solutions to both issues. Simplest: use Givens rotations.
- ➤ Recall: We want to solve least-squares problem

$$\min_y \|eta e_1 - \overline{H}_m y\|_2$$

Transform the problem into upper triangular one.

-14 ______ Text: 6 - Krylov1

➤ 1-st Rotation:

$$\Omega_1 = egin{bmatrix} c_1 & s_1 & & & \ -s_1 & c_1 & & & \ & & 1 & & \ & & & 1 & \ & & & 1 \end{bmatrix}$$
 with: $s_1 = rac{h_{21}}{\sqrt{h_{11}^2 + h_{21}^2}},$ $c_1 = rac{h_{11}}{\sqrt{h_{11}^2 + h_{21}^2}},$

13-15 Text: 6 – Krylov1

Text: 6 - Krylov

$$ar{H}_m^{(1)} = egin{bmatrix} h_{11}^{(1)} & h_{12}^{(1)} & h_{13}^{(1)} & h_{14}^{(1)} & h_{15}^{(1)} \ h_{22}^{(1)} & h_{23}^{(1)} & h_{24}^{(1)} & h_{25}^{(1)} \ h_{32} & h_{33} & h_{34} & h_{35} \ h_{43} & h_{44} & h_{45} \ h_{54} & h_{55} \ h_{65} \end{bmatrix}, \; ar{g}_1 = egin{bmatrix} c_1eta \ -s_1eta \ -s_1eta \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \end{bmatrix}$$

$$\begin{array}{llll} \text{Repeat} & & \\ \text{with } \Omega_2, \\ \dots, \\ \Omega_5. \\ \text{Result:} & & \\ \end{array} \bar{\boldsymbol{H}}_5^{(5)} = \begin{bmatrix} \boldsymbol{h}_{11}^{(5)} & \boldsymbol{h}_{12}^{(5)} & \boldsymbol{h}_{13}^{(5)} & \boldsymbol{h}_{14}^{(5)} & \boldsymbol{h}_{15}^{(5)} \\ & \boldsymbol{h}_{22}^{(5)} & \boldsymbol{h}_{23}^{(5)} & \boldsymbol{h}_{24}^{(5)} & \boldsymbol{h}_{25}^{(5)} \\ & & \boldsymbol{h}_{33}^{(5)} & \boldsymbol{h}_{34}^{(5)} & \boldsymbol{h}_{35}^{(5)} \\ & & & \boldsymbol{h}_{44}^{(5)} & \boldsymbol{h}_{45}^{(5)} \\ & & & & \boldsymbol{h}_{55}^{(5)} \\ & & & & \boldsymbol{0} \end{bmatrix}, \; \bar{\boldsymbol{g}}_5 = \begin{bmatrix} \gamma_1 \\ \gamma_2 \\ \gamma_3 \\ \vdots \\ \gamma_6 \end{bmatrix}$$

-17 ______ Text: 6 - Krylo

Define

$$egin{aligned} Q_m &= \Omega_m \Omega_{m-1} \dots \Omega_1 \ ar{R}_m &= ar{H}_m^{(m)} = Q_m ar{H}_m, \ ar{g}_m &= Q_m (eta e_1) = (\gamma_1, \dots, \gamma_{m+1})^T. \end{aligned}$$

 \triangleright Since Q_m is unitary,

$$\min \|eta e_1 - ar{H}_m y\|_2 = \min \|ar{g}_m - ar{R}_m y\|_2.$$

➤ Delete last row and solve resulting triangular system.

$$R_m y_m = g_m$$

13-18 ______ Text: 6 - Krylov1

Proposition:

- 1. The rank of AV_m is equal to the rank of R_m . In particular, if $r_{mm}=0$ then A must be singular.
- 2. The vector y_m that minimizes $\|eta e_1 ar{H}_m y\|_2$ is given by

$$y_m = R_m^{-1} g_m.$$

3. The residual vector at step $oldsymbol{m}$ satisfies

$$egin{aligned} b - Ax_m &= V_{m+1} \left[eta e_1 - ar{H}_m y_m
ight] \ &= V_{m+1} Q_m^T (\gamma_{m+1} e_{m+1}) \end{aligned}$$

4. As a result, $\|b - Ax_m\|_2 = |\gamma_{m+1}|$.

13-19 Text: 6 - Krylor
